No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed.
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein search, using sw model

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PDGF-C polypeptide can be enzymatically processed to generate the active truncated form of PDGF-C and used to regulate the receptor-binding specificity of PDGF-C and used to regulate the receptor binding specificity of PDGF-C and also be used to promote fibroblast mitogenesis in a mammal and to induce PDGF alpha receptor activation. PDGF-C antagonists can be used to inhibit tumour growth of a tumour expressing PDGF-C in a mammal. Specific types of human tumours, e.g. choriocarcinoma, Wilms tumour, megakaryoblastic leukaemia, lung carcinoma and erythroleukemia, can be identified by testing for expression of PDGF-C. PDGF-C antagonists can also be used to inhibit tissue remodelling during invasion of tumour cells into a normal population of cells. Antagonists can also be used to treat fibrotic conditions, especially found in the lung, kidney or liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents human platelet-derived growth factor C (PDGF-C) (formally designated VEGF-F). PDGF-C polypeptides have the ability to stimulate and enhance proliferation or differentiation, and/or growth or motility of cells expressing a PDGF-C receptor.

PDGF-C polypeptides can be used in pharmaceuticals for promoting cell provides and polypeptides can be used in with one other growth factor.

The transgenic animal is useful as a a transgenic, non-human animal. The transgenic animal is useful as a model to study disease states characterised by over-expression of pDGF-C and to find therapy for those diseases, particularly hypertrophy and and to find therapy organs including the heart. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The patent discloses a method for producing a transgenic, non-human animal over-expressing a platelet derived growth factor C (PDGF-C), or its functional fragment or analogue. The method involves introducing a transgenic PDGF-C DNA into a cell of a non-human animal, introducing a transgenic PDGF-C DNA into a cell of a non-human animal, introducing into a non-human animal and allowing the cell to develop into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A transgenic animal over-expressing platelet derived growth factor useful to study and find therapy for disease associated with PDGF-cover-expression, including cardiac hypertrophy and fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure;

CC therapeutically, especially by expressing encoding polynucleotides, to contract cardiovascular or endothelial disorders in mammals, especially contracts and may especially be used to treat cardiac hypertrophy contracts and may especially be used to treat cardiac hypertrophy contracts and be combined with a carrier in pharmaceutical compositions, which can be administered to treat disorders as above. VEGF-E can be used to contract disorders and agonists, and the antagonists administered to contract antagonists and agonists, and the antagonists antagonists are also caseful therapeutically as antagonists, as above. The antibodies are also cardiovascular, endothelial or angiogenic disorders in mammals (e.g. cancer or consequent disease, or neovascularization associated with tumor formation). By contacting the antibody with a tissue sample and detecting formation of an antibody-VEGF-E polypeptide complex. Polynucleotides encoding contacting the antibody with a tissue sample and detecting formation contains antibody-VEGF-E polypeptide complex. Polynucleotides encoding contacting the antibody with a tissue sample and detecting formation of an antibody-VEGF-E polypeptide complex. Polynucleotides encoding contacting abnormally high or low VEGF-E gene expression in contact and contact and conditions and contact and conditions and conditions are also be used to amutated form of VEGF-E (e.g. a) cardiovascular, endothelial or angiogenic disorder such as a tumor), by detecting a mutation in the VEGF-E-encoding sequence isolated from a cardiovascular, endothelial or angiogenic disorder such as a tumor), by detecting among an used to produce probes useful to detect related complex. Polymer may also be used to amutated form a cardiovascular and endothelial or angiogenic disorder such as a tumor), by detecting among and the veget to dispense a disease or cardiovascular and endothelial or angiogenic disorder such as a tumor), by detecting and the veget to produce probes useful to detect related contracting the veget to produce
                                                                                                                                                      Query Match

The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generatic of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ34338, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present

VEGF-R can be used in assays to identify compounds that bind to it or that antagonize its activity. VEGF-R antagonize its activity. VEGF-R antagonize its activity of inhibiting antagonists (e.g. anti-VEGF-R antibodies) are useful for inhibiting tumour growth and for treating cancer. VEGF-R itself can be used to stimulate tissue growth, angiogenesis and to treat coronary artery blockage. The VEGF-R coding sequence can be used for the recombinant production of the vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; Page 56-58; 62pp;

The invention relates to the human growth factor homologue zvegf4 (AAB48653), and nucleic acids encoding it (AAC81555). Zvegf4 is a member CC of the PDGF (platelet-derived growth factor) VEGF (vascular endothelial CC growth factor) family. Zvegf4 has a growth factor domain (AAB48654) CC characterised by a PDGF cystine knot structure. Zvegf4 has CUB domain CC (AAB48655) which has a beta barrel structure. Zvegf4 has PDGF-like CC growth. The invention also relates to fusion proteins comprising human CC zvegf4 or fragments thereof, particularly human zvegf4 has proteins comprising human CC zvegf4 or fragments thereof, particularly human zvegf4; an antibody CC which binds to human zvegf4 or a fragment thereof; a method of acilivating cells comprising human ccells comprising human cvegf4 or a cell-surface PDGF receptor using a zvegf4 derived polypeptide; a cell-surface PDGF receptor using a zvegf4 derived polypeptide; a cell-surface PDGF receptor using a zvegf4 derived polypeptide; a cell-surface PDGF receptor using a zvegf4 derived polypeptide; a cell-surface PDGF receptor using a zvegf4 derived polypeptide; a cell-surface PDGF receptor using a zvegf4 derived polypeptide; a cell-surface PDGF receptor using a zvegf4 derived polypeptide; a cell-surface PDGF receptor using a zvegf4 derived polypeptide; a cell-surface polypeptides; and a method of detecting a genetic cells comprising exposing bone cells comprising because of a patient. Zvegf4 proteins and derived cells comprising polyperation or cells comprising polyperation or cells compair or the treatment or repair or the treatment of liver damage, and may also be used to stimulate treatment of Alzheimer's disease or matter compair or the treatment of periodontal disease and fractures. They may be used in the treatment of periodontal disease and fractures. They may also be used to the polyperation or proliferation of periodontal disease and fractures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Growth factor homologs and the nucleic acids that encode them, e.g. for treating liver damage, ischemia, multiple sclerosis a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              03-MAY-1999; 99US-0304216

                                            used to enhance expansion and mobilisation of haematopoietic stem cells and endothelial precursor stem cells, which may be useful in the treatment of ischaemia, in wound healing, and in the modulation of the immune system. The present sequence represents human zvegf3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 48;

                                                                                                                                                                                                                                                                promoting wound healing or stimulating smooth muscle growth by administering a platelet-derived growth factor (PDGF) related protein, designated LP8 or its analogue. Also described is a method of slowing the progress of atherosclerosis or treating atherosclerosis comprising the administration of an LP8 antagonist. The method is useful for enhancing tissue growth, promoting wound healing and stimulating smooth muscle growth. Antagonists of LP8 are useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                     Enhancing tissue growth and promoting wound healing by administering platelet-derived growth factor related protein, LP8 or its analog and treating atherosclerosis by administering LP8 antagonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAB24250 standard;

AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane polypeptides. The PRO polynucleotides and polypeptides have cytoactivity. The polynucleotides and polypeptides can be used for discretivity.
                                               Claim
                                                               Novel PRO polypeptides and polto target bioactive molecules cellular activities -

The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bioactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in

XX

New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity preventing diseases associated with inappropriate angiogenesis activity preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds.

XX

Disclosure; Fig 6; 127pp; English.

XX

CC (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and can antidabetic activity and acts as an angiogenesis and vascularization cregulator. An antisense molecule of the invention is useful for treating cregulator. An antisense molecule of the invention is useful for treating cregulator. An antisense molecule of the invention is useful for treating cregulator. An antisense molecule of the invention is useful for treating cregulator. An antisense molecule of the invention of new blood crescels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful cressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair by promoting angiogenic activity or vascularization. This sequence repairs by promoting angiogenic activity or cresularization. This sequence represents the RACE generated human VEGF-X protein described in the method of the invention.

                                                                                                                                                                                                                                                                                   This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an anglogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure scress, venus sores, diabetic ulcers and burns and to promote

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT
This invention describes a novel vascular endothelial growth factor-X (VEGF-X), protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeare the development of tissues, tissue regearenting medicaments for treating wounds such as dermal ulcers,
                                                                                                                                                                                                     New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.

CC (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has CC vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and CC antidiabetic activity and acts as an angiogenesis and vascularization CC or preventing cancer, rheumatoid arthritis, psoriasis and diabetic CC retinopathy by inhibiting angiogenic activity or inappropriate CC vascularization including formation and proliferation of new blood CC vessels, growth and development of tissues, tissue regeneration and organ CC and tissue repair in a subject. The products of the invention are useful CC pressure sores, venous sores, diabetic ulcers and burns and to promote CC skin graff growth, tissue repair by promoting angiogenic activity or consultation. This sequence represents the human VEGF-X protein XX

Novel PRO polypeptides useful for preventing or rescuing retinal ce from injury caused by ocular diseases such as retinitis pigmentosa, retinopathy, retinal degenerative diseases, degenerative myopia, uveitis

Claim 2; Fig 2; 140pp; English

producing PRO polypeptides, including PRO200, using a host cell transformed with a vector comprising a PRO nucleic acid is claimed. The invention relates to the use of PRO polypeptides to delay. The invention relates to the use of PRO polypeptides to delay. The invention relates to the use of PRO polypeptides to delay. The invention relates to the use of PRO polypeptides to delay. The invention relates to the use retinal neurons selected from photoreceptors, retinal ganglion cells, displaced retinal ganglion cells, amacrine cells, displaced amacrine cells, horizontal and bipolar neurons, and supportive cells (including Mueller cells and pigment epithelial cells) from injury and degradation. The retinal cells are preferably photoreceptors and photoreceptor cell injury or death is caused by retinal injury, light or environmental trauma or by an ocular disease selected from retinitis pigmentosa, macular degeneration, including age-related, retinal detachment, retinal characteristic myopia, acute retinal necrosis syndrome, traumatic chorioretinopathies or contusion such as Purtscher's retinopathy, cellagen vascular diseases, thrombocytopenic purpura, uveitis, retinal vascular alseases, thrombocytopenic purpura, clone (see AĀA88515) that was isolated from a glioma cell line G61 library using probes (see AAA88523-26) based on an expressed sequence tag (see AAA88522) that showed homology to VEGF. PRO200 has a predicted mol. wt. of 39,029 and a pl of about 6.06. A method for The present sequence is that of human PRO200 or vascular endothelial growth factor ${\tt E}$ (VEGF-E), as predicted from systemic lupus erythematosus Ø CDNA

Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumato arthritis, osteoarthritis, thyroiditis and diabetes mellitus rheumatoid -

Claim 33; Fig 2; 309pp; English.

The present invention describes sixty four human PRO proteins which can CC be used in the treatment of immune related diseases. The human PRO CC proteins, anti-PRO antibodies, agonists and antagonists are useful for CC treating and diagnosing immune related disorders. The disorders are Steelected from systemic lupus erythematosus, rheumatoid arthritis, costeoarthritis, juvenile chronic arthritis, spondyloarthropathies, Systemic sclerosis, idiopathic inflammatory myopathies, Sjoyren's CC syntemic sclerosis, idiopathic inflammatory myopathies, Sjoyren's CC syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic canaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, CC immune-mediated renal disease, demyelinating diseases of the central CC and peripheral nervous systems, hepatobiliary diseases, inflammatory CC bowel disease, gluten-sensitive enteropathy and whipple's disease, CC immunological diseases of the lung, and transplantation associated CC diseases including graft rejection and graft-versus-host-disease. CC diseases including graft rejection and graft-versus-host-disease. CC AAC58397 to AAC5878 represent PCR primers and hybridisation probes used C1 in the isolation of human PRO sequences. AAC58679 and protein CC sequences given in the exemplification of the present invention.
